EXPRESS ENTERPRISE

E eXpress Enterprise

OVERVIEW

Version 5 of eXpress integrates and replaces previous releases of eXpress Plus, Pro and Net to create a complete package called eXpress Enterprise. A single installation of eXpress Enterprise contains all the components necessary to implement eXpress Enterprise as a standalone desktop application or a centrally administered application on a Web server. A software development kit (SDK) with a mainframe communications component is included for sites needing the ability to produce customized Windows applications using Visual Studio, Visual Basic, Delphi, etc. A single installation of eXpress Enterprise will accommodate any implementation requirement that a site might have.

KEY BENEFITS

Increased Productivity

Use the Input Recall feature to retrieve and reissue frequently entered commands or strings. Launch user-developed scripts or macros from a menu selection, toolbar button or hot key to perform tedious or repetitive tasks. Both facilities are guaranteed to increase user productivity.

The Software Development Kit

Windows applications can now communicate with ClearPath OS 2200 host or ClearPath MCP applications. This extraordinary capability is perfect for sites that want to go beyond simple emulation, and into new Windows possibilities. The SDK was designed specifically for programmers, technicians and developers who are accustomed to using their own programming tools, but want the added advantage of customized applications plus emulation.

Web Implementation

eXpress Enterprise is ideal for sites wanting centralized control over

The Most Complete Emulation Package for ClearPath OS 2200 and ClearPath MCP Servers

installation and configuration with a minimum footprint at the client level. With "zero touch" rollout, there is no install on the client PC. Furthermore, Viewing and maintaining host data from a web browser makes the mainframe truly portable.

Integrate your Desktop

eXpress easily interacts with other applications that you may already use, tools like Microsoft Outlook, Word and Excel, just to name a few. Leverage your existing investments by allowing eXpress products to help increase productivity in today's workplace environments.

Completely New Scripting Engine

BasicScripts, PascalScripts or Jscripts are all available to boost the productivity power of Enterprise. Maintaining scripts in a language compatible with commonly used application development packages (Visual Studio, Visual Basic, Delphi and Java) offers shops the ability to standardize and simplify their development efforts.

Security Where It Counts

Enterprise fully supports direct-to-host SSL connections. It also supports SSL connections to Host Gateway Server (HGS) from KMSYS Worldwide, Inc. acting as a secure gateway to a ClearPath system with or without SSL capability. When partnered with HGS, Enterprise provides additional functionality and authentication beneficial to site security and performance. HGS includes a utility to configure multiple servers, listeners, paths and virtual destinations. Another utility allows an administrator to monitor performance and throughput. Built on the Microsoft .NET Framework, HGS is compliant with Federal Information Processing Standards (FIPS 140) and is a serious consideration when data security is of utmost importance.
